

Executive Summary

The IT Support Portal is a role-aware operational platform that unifies support tickets, employee records, onboarding, inventory governance, asset allocation, SOP execution, organisation management, and MDM integration. It reduces manual coordination, improves visibility for management, and creates a reliable system of record for day-to-day IT operations.

Business Area	What the portal does	Management value
Support	Centralises ticket intake, assignment, comments, and closure	Faster resolution and transparent service history
People	Maintains employees, onboarding, client profiles, and org structure	Cleaner workforce records and smoother joiner flow
Assets	Manages hardware, software, allocation, recovery, and QR labels	Lower asset loss and better spend control
Standards	Creates and executes SOPs with checklist steps	More consistent operations across teams
Integrations	Connects to SureMDM and imported installed-app data	Better endpoint visibility and automated sync

1. Core Features

- Dashboard with live KPIs, charts, and role-based shortcuts.
- Support ticketing with create, view, assign, resolve, close, and comment workflows.
- Employee directory with filtering by organisation and core process.
- Employee detail dashboard with identity, organisation, email, and assigned asset history.
- New joiner onboarding with request intake, confirmation, and rejection controls.
- Inventory management for hardware and software with configurable attributes.

- Bulk asset template download and Excel upload for faster data onboarding.
- Asset allocation for both hardware and software, including recovery and revocation.
- QR code generation and printable labels for assigned hardware.
- Device dashboard showing MDM data, installed applications, and imported report upload.
- Inventory configuration for asset types and custom attributes.
- SOP repository with search, categories, step-by-step detail, and execution mode.
- User management with roles and activation state control.
- Organisation directory with base and client orgs, locations, and member profiles.
- SureMDM integration setup, testing, syncing, and device filtering.

2. Role-Based Access

- Super Admin can access all modules, including user and organisation administration.
- HR can manage employees and onboarding workflows.
- IT Specialist can manage inventory, allocation, SOPs, integrations, and support operations.
- Employees can use the portal for tickets and self-service where permitted.

3. Why It Matters

- Reduces time spent on spreadsheets, email chains, and manual handoffs.
- Improves accountability with status histories, comments, and audit-friendly records.
- Gives leadership real-time visibility into support demand and asset availability.
- Supports faster onboarding and asset provisioning for new joiners.
- Lowers risk through structured access control and standard operating procedures.

Feature walkthrough with visual References

The following panels mirror the main portal areas and help management understand how each module supports daily operations.

Executive dashboard

The landing page gives management immediate operational visibility across employees, tickets, assets, MDM systems, and pending onboarding.

Users can raise incidents, support staff can assign work, change status, and keep the discussion in one place.

Inventory and allocation

The inventory module manages configurable asset types, bulk uploads, hardware recovery, and software licences.

Org structures, member profiles, and locations are maintained centrally for clean governance.

SOP management

Procedures are searchable, categorised, and executable step by step for repeatable service delivery.

Recommended Management Benefits

Benefit	Explanation
Operational visibility	Leadership can see support demand, asset health, onboarding load, and MDM coverage in one system.
Lower manual effort	Bulk uploads, configurable attributes, and reusable SOPs cut down repetitive administration.
Improved control	Role-based access keeps HR, IT, admin, and employee actions appropriately separated.
Traceability	Tickets, allocations, confirmations, comments, and recoveries all leave a visible history.
Faster onboarding	New joiners can be captured, confirmed, provisioned, and tracked with fewer handoffs.
Better asset stewardship	Hardware and software inventory are managed with assignment, recovery, and utilisation views.

Overall, the portal acts as a single operating layer for IT and HR workstreams. It is especially useful when management needs a dependable view of service volume, hardware allocation, onboarding readiness, and compliance with internal procedures.
